

PNCI Basic Information

The METI Program for Nursing Curriculum Integration (PNCI) is a powerful learning package focusing on nursing educational concepts and competencies in the existing undergraduate nursing curriculum.

This comprehensive program assists deans, directors and nursing faculty to provide the most complete education for their learners. The PNCI utilizes established competency standards and educational objectives that can help to improve the overall quality of patient care and safety.

The program includes 100 Simulated Clinical Experiences (SCE™) that may be utilized in any nursing curriculum to fulfill current limitations in clinical sites, difficulty in understanding concepts and/or mastering skills. The SCE is the tool that brings the learning experience to life. Each SCE is a turnkey module empowering faculty to deliver the learning strategy with minimal effort. SCEs are evidence-based and utilize best-practice standards to address regional variations, while allowing faculty to modify the simulation to meet individual objectives and learner needs.

Each SCE includes the following information:

- Synopsis
- History
- Healthcare Provider's Orders
- Learning Objectives
- NCLEX Test Plan
- Questions for Students to use in preparation for the SCE
- Suggested Equipment, Supplies and Simulator Setup
- Notes to help the instructor prepare for the SCE
- References for the evidence-base used in development of the SCE
- Scenario with states, simulator responses, expected student minimal behaviors and appropriate prompts for faculty
- SBAR Worksheet

To ensure successful implementation of the Program for Nursing Curriculum Integration, a METI-certified nurse educator will provide consultation at your facility. Nurse educators are always available at METI to answer questions to assist in implementation and ongoing.
